(54) Title: INFRA-RED LIGHT SOURCE

22 MA | 9 20 22

10 26 | 14 26 | 16 18 20

(57) Abstract: A method for increasing the spectral stability of cold cathode discharge infra-red light sources is described, especially for sources operating with a carbon dioxide fill. A catalyst is added inside the lamp envelope to induce recombination of the dissociation products of molecules of the fill gas broken down by the action of the electrical discharge, thus reducing the changes with time in the concentration of excited gas molecules in the lamp active in emitting to ground state levels. Maintenance of the level of self absorption of the lamp emission results in a concomitant maintenance of the spectral shape of the lamp emission.

EXAMINATION REPORT - SEPARATE SHEET

The following documents are mentioned in this report:

D1=US-A-5300859

D2=US-A-4757512

D3=GB-A-1591709

D4=EP-A-0415600

D5=US-A-4756000

D6=US-A-4490482

D7=US-A-4639432

1. D1 (see figures 1 and 2) discloses an IR-radiation lamp according to lines 1-7 of the present claim 10, and a manufacturing method according to lines 1-7 of present claim 1. D1 is also considered by the Applicant as nearest prior art. According to the present claims 1 and 10, a catalytic material is additionally applied within the lamp envelope.

It is a known problem with CO₂ IR-sources that the CO₂ dissociates, and that measures have to be taken which keep the CO₂ concentration at a certain level in order to maintain the required specifications. This is necessary not only in IR-laser resonators (see eg. D2, column 1, lines column 3, lines 18-29), but also in IR-lamps (see D3) or any other IR source (see D4, page 4, lines 55-58). A well known measure is to place a catalytic material into the closed envelope of the CO₂ IR source, in order to reestablish the original CO₂ level (see D2, D4-D7).

Therefore, the general idea of using a catalyst in an IR-lamp does not involve an inventive activity. For this reason, the subject-matter of claims 1, 8, and 10, 14, lacks an inventive step (Article 33.3 PCT).

2. The advantageous effects mentioned in the application (see eg. page 10, last paragraph, to page 11, second paragraph) are extra effects which may also be obtained applying the aforementioned idea. This appears to apply with respect to claim 2 and 11 (reduction of the change in self-absorption), or to the advantages expressed in claims 5 and 7. The possible reduction in size or CO2 concentration appears to be implied by the fact that the catalyst avoids CO2 losses and no excess CO2 needs to be provided.

Note, however, that claims 5 and 7 are not clear in the sense of Article 6 PCT (unclear scope of protection), because only an optional reduction in size or CO2 concentration is **EXAMINATION REPORT - SEPARATE SHEET**

claimed ("... can be decreased"), so that claims 5 and 7 do not define a clear limitation with respect to claim 1.

Suitable catalyst materials are known from D2 (silver), D4 (deuterium), D5 (gold), D6 (platinum, palladium), D7 (nickel, rhodium, iridium).

D2 shows that the catalyst material, silver in this case, may be coated on an inside wall of the laser resonator (see figure 2, column 8, lines 32-42).

For these reasons, the subject-matter of claims 2-5, 7, and 11-13, lacks an inventive step.

- The present application does not meet the requirements of Rules 5.1.a.ii and 6.3.a PCT, because claims 1 and 10 are not fully supported by the description. There is only support for a catalyst for regenerating the IR active medium, only one of which (CO₂) has been discussed as an example. No catalyst for other purposes was indicated in the application.
- 4. The subject-matter of claims 6 and 9 is not derivable from the cited documents and meets therefore the requirements of Article 33.3 PCT).
- 4. The documents referring to the catalyst materials should be identified in the description, according to Rule 5.1.a.ii PCT.
